

# 1. Prime numbers

**Definition 1.1:** A natural number is called a *prime number* if it is greater than 1 and cannot be written as the product of two smaller natural numbers.

*Example:* The numbers 2, 3, and 17 are prime. Corollary 1.1.1 shows that this list is not exhaustive!

**Theorem 1.1** (Euclid): There are infinitely many primes.

*Proof:* Suppose to the contrary that  $p_1, p_2, \dots, p_n$  is a finite enumeration of all primes. Set  $P = p_1 p_2 \dots p_n$ . Since  $P + 1$  is not in our list, it cannot be prime. Thus, some prime factor  $p_j$  divides  $P + 1$ . Since  $p_j$  also divides  $P$ , it must divide the difference  $(P + 1) - P = 1$ , a contradiction.  $\square$

**Corollary 1.1.1:** There is no largest prime number.

**Corollary 1.1.2:** There are infinitely many composite numbers.
