

1. Prime numbers

Definition 1.1 : A natural number is called a *prime number* if it is greater than 1 and cannot be written as the product of two smaller natural numbers.

Example : The numbers 2, 3, and 17 are prime.

Theorem 1.1 (Euclid) : There are infinitely many primes.

Proof: Suppose to the contrary that p_1, p_2, \dots, p_n is a finite enumeration of all primes. Set $P = p_1 p_2 \dots p_n$. Since $P + 1$ is not in our list, it cannot be prime. Thus, some prime factor p_j divides $P + 1$. Since p_j also divides P , it must divide the difference $(P + 1) - P = 1$, a contradiction. \square

Corollary 1.1.1 : There is no largest prime number.

Corollary 1.1.2 : There are infinitely many composite numbers.
